Election/Restrictions

1. This application contains claims directed to more than one species of the generic invention. These species are deemed to lack unity of invention because they are not so linked as to form a single general inventive concept under PCT Rule 13.1.

The species are as follows:

- I. An apparatus of a quadrate polarized antenna.
 - II. An apparatus/method for preprocessing incoming signal has a smoother.
 - III. An apparatus/a method for preprocessing incoming signal has a covariance unit.
2. Applicant is required, in reply to this action, to elect a single species to which the claims shall be restricted if no generic claim is finally held to be allowable. The reply must also identify the claims readable on the elected species, including any claims subsequently added. An argument that a claim is allowable or that all claims are generic is considered non-responsive unless accompanied by an election.

Upon the allowance of a generic claim, applicant will be entitled to consideration of claims to additional species which are written in dependent form or otherwise include all the limitations of an allowed generic claim as provided by 37 CFR 1.141. If claims are added after the election, applicant must indicate which are readable upon the elected species. MPEP § 809.02(a).

3. The claims are deemed to correspond to the species listed above in the following manner:

- I. Claims 1-10, 11-21.
- II. Claims 11-12, 22-26, 27-34 and 39-44.

III. Claims 35-38 and 45-47.

The following claim(s) are generic: 11-12 for Species I and II.

The species listed above do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, the species lack the same or corresponding special technical features for the following reasons:

- I. The Species draws to an apparatus of a quadrate polarized antenna element, among with other feature, has a plurality of electric dipoles and magnetic dipoles which are co-located, and two electric dipoles are mutually orthogonal and the magnetic dipoles are mutually orthogonal, and wherein each of the magnetic dipoles is co-directed with one of the electric dipoles, and an electric switch.
- II. The Species draws to an apparatus/method for preprocessing incoming signal, among with other features, has a smoother configured for smoothing the autocorrelation matrices to form a covariance matrix suitable for use in an eigenstructure-based signal source localization technique.
- III. The Species draws to an apparatus/a method for preprocessing incoming signal, among with other features, has a covariance unit for forming a sample covariance matrix from signal autocorrelation matrices which is suitable for use in maximum likelihood estimator for estimating source localization, and the formula of the maximum likelihood estimator.
